

Tela™ 80

Tela 80 is acoustically transparent fabric screen surface engineered for both visual fidelity and acoustical integrity.

Key Benefits:

1

Enhanced acoustical transparency which allows for more flexibility for speaker placement behind the material

2

Compatible with a wide range of projectors for moiré free performance

3

Offers a wide viewing cone for flexibility and versatility in home theater applications

Tela 80

For audio purists who want the most realistic soundstage when watching movies and concerts, Stewart Filmscreen offers Tela 80. A woven fabric screen material, Tela 80 supports locating speakers directly behind the image with minimum attenuation and the greatest flexibility for placement.

An environment with controlled lighting is ideal for Tela 80. With its 81 degree wide viewing cone, Tela 80 can work with virtually any seating arrangement. The surface's flat spectral response curve assures that colors and skin tones will be life like and accurate. Tela 80 comes standard with an opaque black backing screen to eliminate possible interference from light reflection behind the screen.

The screen surface is completely uniform. It resists hot spotting and works extremely well with short throw projectors. With a 0.82 gain, Tela can be used with a range of projector light engines and output ratings.

FEATURES

- Acoustically transparent
- Best performance with controlled light applications
- Highly accurate spectral response
- Extra-wide viewing angle
- Excellent white field uniformity with short focal length

SPECIFICATIONS

- Material Type: Flexible fabric material
- Gain: 0.82
- Half Gain: 81 degrees
- Minimum Throw Distance: N/A
- Ambient Light Front Reflectance Value: 0.85% per foot-candle
- Flame Resistance: Yes
- Maximum Size: Contact Factory
